- High-mass, relativistic *γ*-ray emitting binaries are efficient, complex accelerators and powerful high-energy sources.
- Important elements common to all these sources:
  - Relativistic outflows: winds and jets.
     (BINAR)
  - Dense radiation field.
  - Substantial and structured stellar wind.
  - Relativistic effects
  - Shocks, instabilities and mixing.
  - Magnetic fields
  - Orbital motion and eccentricity.
  - Interactions on large scales.

#### (BEYOND BINARY SCALES)

#### 1 Introduction

Beyond binary scales

#### 4 Concluding

#### • In a HMMQ:

- A jet can form, protected from the stellar wind by accretion flows.
- Magnetization, content and velocity are unclear, possibly structured.
- The jet can already suffer internal or recollimation shocks, and mass-load.
- In a non-accreting pulsar:
  - The unshocked pulsar wind is expected to be magnetized, anisotropic and ultrarelativistic.
  - The pulsar wind is accelerated by a mechanism (B) of unclear efficiency.
- Relativistic outflow and dense local field: the converter mechanism can operate.
- Unshocked outflows can already emit.

(Barkov & Khangulyan 2012-MQ-)

#### (Aharonian et al. 2012-PSR-)

- Relativistic jet or wind is shocked from the star side.
- $\rightarrow$ Shocked flow soon unstable.
- In HD, Richtmyer-Meshkov, R.-T., ٠ and K.-H. instabilities important.
- Instabilities+mixing at all scales?
- What is the role of B?

V. Bosch-Ramon (UB)

- In winds, as  $\sigma \sim 1$ , postshock physics is affected:
  - The anisotropic *P<sub>B</sub>* modifies size and geometry.
  - Flow direction and velocity are strongly modified.
  - Reconnection can occur in shocked flow current sheets.
- In winds and jets, *B* can both enhance or suppress instability.

- For powerful systems, mass and momentum come from the stellar flows, and energy from relativistic outflow; consequences:
  - A non-beamed energy source could halt flow beyond r<sub>Bondi</sub>.
  - Shocked flows pushed away from star and out of the binary.
  - Shocked flows prone to instabilities, mixing, reacceleration.
- Intense radiation bath; consequences:
  - IC likely dominant; synchrotron important; radiative/adiabatic.
  - What happens with the absorbed γ-rays (radio to VHE)?
- Orbital motion; consequences:
  - Shocked flows, compressed and disrupted, form a spiral.
    Stellar wind presence leads to mixing and isotropization.
- Large scale medium; consequences:
  - A powerful mixed flow cools adibatically and accelerates.
     Medium interaction ideal for non-thermal processes.

  - Stellar wind presence leads to mixing and isotropization.
- Large scale medium; consequences:
  - A powerful mixed flow cools adibatically and accelerates.
    Medium interaction ideal for non-thermal processes.

・ロト ・ 四ト ・ ヨト ・ ヨト

- For powerful systems, mass and momentum come from the stellar flows, and energy from relativistic outflow; consequences:
  - A non-beamed energy source could halt flow beyond r<sub>Bondi</sub>.
  - Shocked flows pushed away from star and out of the binary.
  - Shocked flows prone to instabilities, mixing, reacceleration.
- Intense radiation bath; consequences:
  - IC likely dominant; synchrotron important; radiative/adiabatic.
  - What happens with the absorbed γ-rays (radio to VHE)?
- Orbital motion; consequences:
  - Shocked flows, compressed and disrupted, form a spiral.
  - Stellar wind presence leads to mixing and isotropization.
- Large scale medium; consequences:
  - A powerful mixed flow cools adibatically and accelerates.
    Medium interaction ideal for non-thermal processes.
